

## Group Project Assignment 2: HTML

### Team DayTa

**Description:** This assignment is the HTML (and some CSS) code we will use to establish a foundation for our website.

**Approach/What we did:** We started the project off by using our group project assignment 1 PDF to guide us on how we would set up the navigation and text on each website page. Once that was established, we created an html file for each of the webpages and then Dale created the navigation and pasted it to each of the pages making it easy for us to edit each of our pages with title headings and any necessary text.

#### **Issues & Resolution:**

1. Dale made an error on the navigation on earth.html. It wasn't displayed properly and was quickly resolved by fixing a typo.
2. Alexandra had trouble with a pull command at one point because the github branch was out of sync. To solve this problem we first googled the issue, then got assistance from Andrew and learned about a command that would help to make sure that our files merged properly.
3. Yejin encountered an issue related to how to insert charts onto a page when working on visualization. Initially, I thought I needed to allocate a separate page for each category. However, Dale showed me a method to insert charts without allocating multiple pages, which solved the problem. (I used JS for the insertion.)

**Analysis:** Overall this assignment presented a handful of challenges for us as a team and individuals, but they were not too difficult for us to resolve. The main concerns were regarding setup and making sure we were each up to date with the repository and not out of sync with each other's work.
